End-to-end machine learning

Lecture 02

Supervised Machine Learning Process

- 1. Define your problem, set your goal, and how you will measure success
- 2. Get the data

- Deep dive 3. Explore and prepare the data
 - 4. Propose one or more hypotheses: prospective models
 - 5. Evaluate model performance and iteratively fine tune
 - 6. Deploy your model

Create training / validation / test data split

Ensure your training data are representative of your test data (sometimes need to use stratified sampling to avoid sampling bias)

Train

Used for model training / fitting

Validation

Used to approximate generalization performance and guide model development

Test

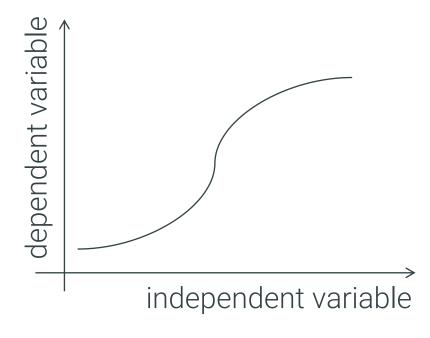

DO NOT TOUCH

Used to evaluate generalization performance of the final model

Technical note: don't create a DIFFERENT random sample of the dataset each time you run your code – this will expose your modeling to more of the data and contaminate your train/test split

Quick aside:

Common language on variables

independent variable

input predictor feature

dependent variable

output response target

У

Supervised learning in practice

Preprocessing Explore & prepare data

Data Visualization and Exploration

Identify patterns that can be leveraged for

learning

Scaling (Standardization)

Prepare data for use in scale-dependent algorithms.

Data Cleaning

- Missing data
- Noisy data
- Erroneous data

Feature Extraction

Dimensionality reduction eliminates redundant information

Model training

Select models (hypotheses)

Select model options that may fit the data well. We'll call them "hypotheses".

> Fit the model to training data

Pick the "best" hypothesis function of the options by choosing model parameters

Iteratively fine tune

the model

Performance evaluation

Make a prediction on validation data

Metrics

Classification

Precision, Recall, F₁, **ROC Curves** (Binary), **Confusion Matrices** (Multiclass)

Regression

MSE, explained variance, R²

B Handling Categorical data

Data Cleaning

Recall ocean_proximity has the following categories:

We need to convert this into numerical data to process it

<1H OCEAN

INLAND

NEAR OCEAN

NEAR BAY

ISLAND

Assign numbers to each class

Original value	New feature value
<1H OCEAN	0
INLAND	1
NEAR OCEAN	2
NEAR BAY	3
ISLAND	4

Create one binary feature for each category

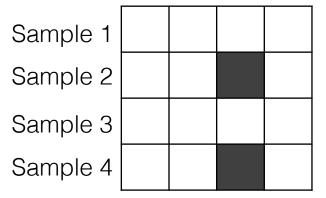

Original value	F_1	F_2	F_3	F_4	F_5
<1H OCEAN	1	0	0	0	0
INLAND	0	1	0	0	0
NEAR OCEAN	0	0	1	0	0
NEAR BAY	0	0	0	1	0
ISLAND	0	0	0	0	1

What do these numbers mean?

One-hot-encoding: create a new feature for each category

B Handling missing data Cleaning Data Cleaning

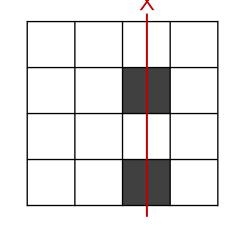

total_bedrooms contains missing values

Feature 3 has 2 missing values

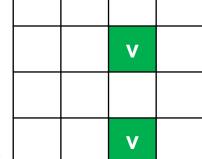

Options:

- Remove samples that have missing values
- Remove features that have missing values
- Fill in (impute) the missing values
 - Fill with average or median
 - Compute a value based on other features

3

2

v = replacement values

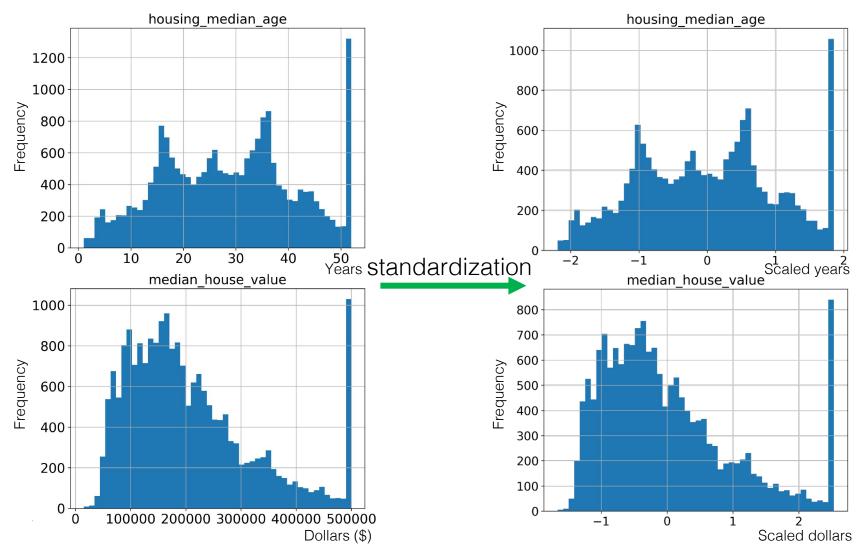

Scaling features

Standardization

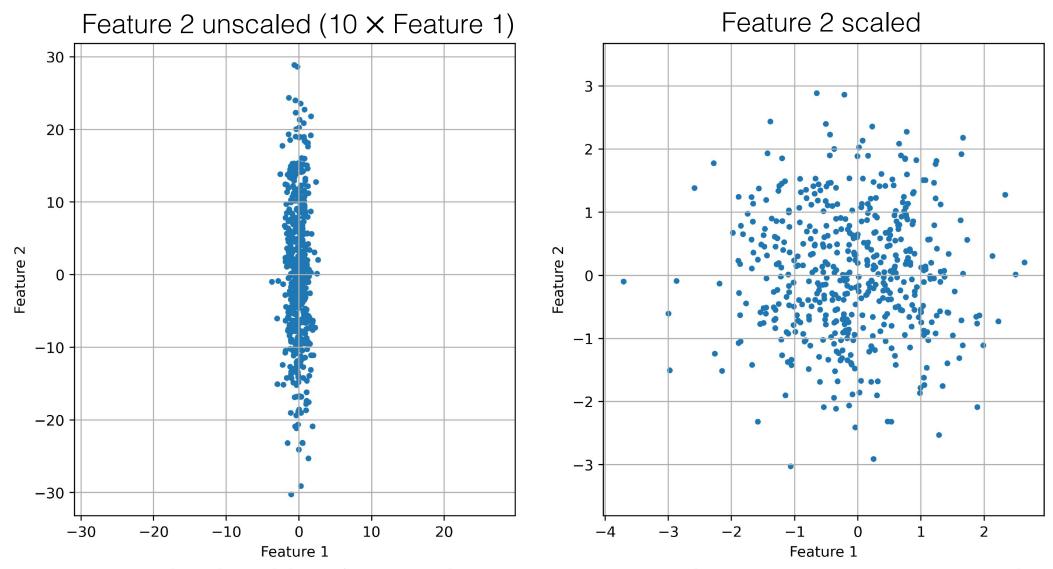

$$x^{new} = \frac{x - \overline{x}}{\sigma(x)}$$

Subtract the mean, divide by the standard deviation

Why do we care about scaling?

Feature scaling is critical for algorithms that rely on distances between data points

Explore correlations in the data to begin identifying important variables

Correlation with our response variable, median_house_value:

1	median_house_value	1.000000
2	modian incomo	0 600617

4	housing_	_median_age	0.103706
---	----------	-------------	----------

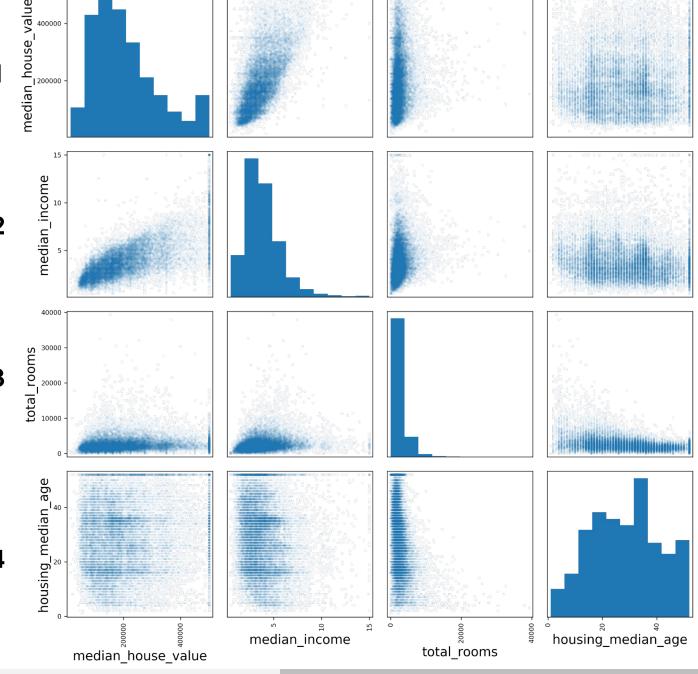

households	0.06371

total_bedrooms	0.047980

population	-0.02603	32
population	0.0200	_

longitude	-0.046349

latitude	-0.14298
----------	----------

Adapted from from Hands-On Machine Learning with Scikit-Learn & TensorFlow by Aurélion Géron

Transform variables (feature engineering)

median_house_value
median income
total_rooms
housing_median_age
households
total_bedrooms
population
longitude
latitude

Resulting correlations:

rooms_per_household = total_rooms / households

bedrooms_per_room = total_bedrooms / total_rooms
population_per_household = population / households

```
median_house_value
                             1.000000
median_income
                             0.690647
rooms_per_household
                             0.158485
total_rooms
                             0.133989
housing_median_age
                             0.103706
households
                             0.063714
total bedrooms
                             0.047980
population per household
                            -0.022030
population
                            -0.026032
longitude
                            -0.046349
latitude
                            -0.142983
bedrooms per room
                            -0.257419
```

Adapted from from Hands-On Machine Learning with Scikit-Learn & TensorFlow by Aurélion Géron

Preprocessed data

- Divided our data into training and testing sets
- Viewed the data and looked for problems
- Engineered new features that have real-world meaning
- Categorical data transformed into binary features (1-hotencoding) enabling ML techniques
- Missing values replaced (imputed)
- Features standardized (now have zero mean and std of 1)

We're ready to train a machine learning model and evaluate performance

Supervised learning in practice

Preprocessing Explore & prepare data

Data Visualization and Exploration

Identify patterns that can be leveraged for learning

Data Cleaning

- Missing data
- Noisy data
- Erroneous data

Scaling (Standardization)

Prepare data for use in scale-dependent algorithms.

Feature Extraction

Dimensionality reduction eliminates redundant information

Model training

Select models (hypotheses)

Select model options that may fit the data well. We'll call them "hypotheses".

Fit the model to training data

Pick the "best" hypothesis function of the options by choosing model parameters Iteratively fine tune the model

Performance evaluation

Make a prediction on validation data

Metrics

Classification

Precision, Recall, F₁,
ROC Curves
(Binary),
Confusion Matrices
(Multiclass)

Regression

MSE, explained variance, R²

Model Training Considerations

Model Selection

K-Nearest Neighbors
Linear regression
Logistic regression
Linear Discriminant Analysis
Naïve Bayes
Classification and Regression Trees
Random Forests
Support Vector Machines
Neural Networks

We will spend the first half of the course on these pieces

Other Considerations

Combine models through ensembles (bagging, boosting, stacking)

Selecting cost functions

Regularizing our models to avoid overfit

Selecting model hyperparameters through grid search or random search

Experiment with three models

Validation data performance

Model	Root Mean Square Error RMSE (\$)	RMSE / Median Home Price * 100 (%)
Linear regression	68,628	38.1
Random forest	52,564	29.2
Random forest with feature selection	49,694	27.6

Once we have a model we are confident in, we can evaluate our generalization performance on our **test set**:

Test set performance

47,766

26.5

Operationalizing the solution

Now the code needs to be run at scale (production-grade code, production environment)

The ML solution will need to be maintained and updated (Update the codebase, update model with new data)

Continued monitoring of accuracy will be required (check for model drift – are distributions changing?)

How fast does it need to run? (i.e. in real-time)

Supervised learning in practice

Preprocessing Explore & prepare data

Data Visualization and Exploration

Identify patterns that can be leveraged for learning

.

Scaling (Standardization)

Prepare data for use in scale-dependent algorithms.

Data Cleaning

- Missing data
- Noisy data
- Erroneous data

Feature Extraction

Dimensionality reduction eliminates redundant information

Model training

Select models (hypotheses)

Select model options that may fit the data well. We'll call them "hypotheses".

Fit the model to training data

Pick the "best" hypothesis function of the options by choosing model parameters Iteratively fine tune evaluation

the model

Make a prediction on validation data

Performance

Metrics

Classification

Precision, Recall, F₁, ROC Curves (Binary), Confusion Matrices (Multiclass)

Regression

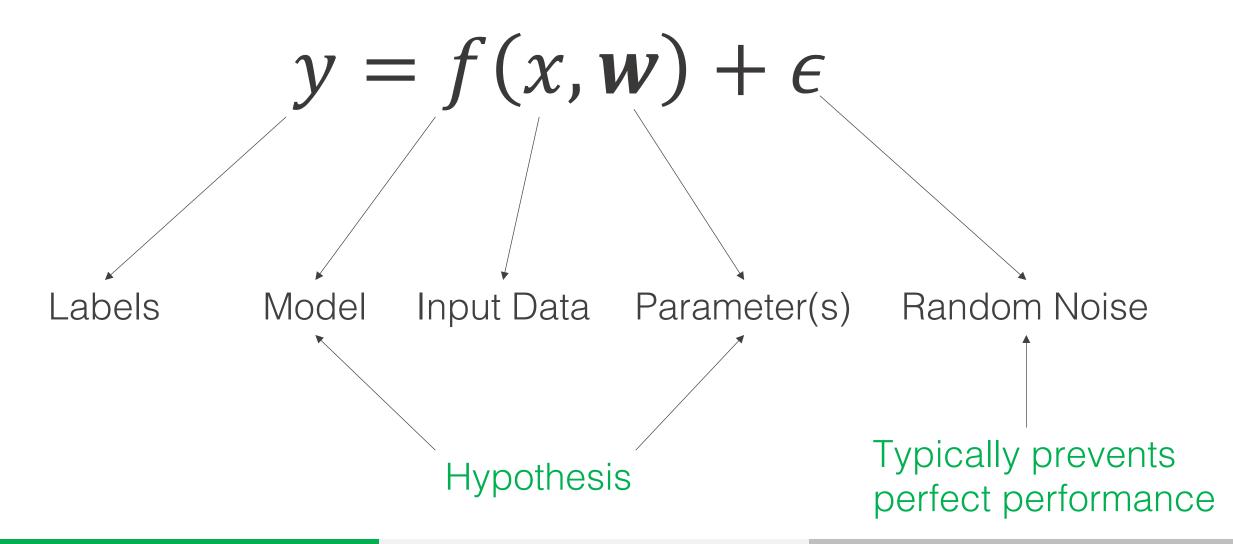

MSE, explained variance, R²

Components of supervised learning

Supervised machine learning model

We search for the model that best fits our data

Components of supervised learning

Input

X

Output

y

Training Data

 $(x_1, y_1), (x_2, y_2), ..., (x_N, y_N)$

Target function

 $f(x) \rightarrow y$

This is unknown, but the best you could ever do

Hypothesis set

 $f_i(x) \to \hat{y}$

Functions to consider in trying to approximate f(x)

Learning algorithm

Optimization technique that searches the hypothesis set for the function f_i that best approximates f (typically by choosing parameters in a model)

Supervised Learning

Unobservable

Data Generating Process

p(X,Y)

Target Function

The best function predicting *y* from *x*

$$f(x) \rightarrow y$$

Observable

Training Data

$$(x_1, y_1), \dots, (x_N, y_N)$$

Learning Algorithm

Chooses a hypothesis, $\hat{f} = f_i$ based on the training data such that

$$\hat{f}(x) \approx f(x)$$

Hypothesis Functions Set

$$f_1, f_2, f_3, \dots$$

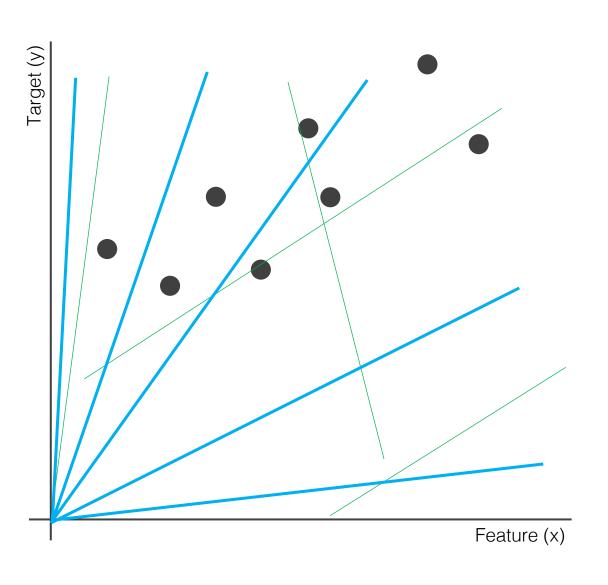

- Need to select the hypothesis functions (models to train)
- Need to select the learning algorithm (for fitting the models to the data)

Final Hypothesis

predictions

 $\hat{f}(x) \to \hat{y}$

Example: linear regression

Using any line as a hypothesis function, how many possible hypothesis functions are in the set?

Infinitely many

Using the line y = wx as the family of hypothesis functions, how many possible hypothesis functions are in the set?

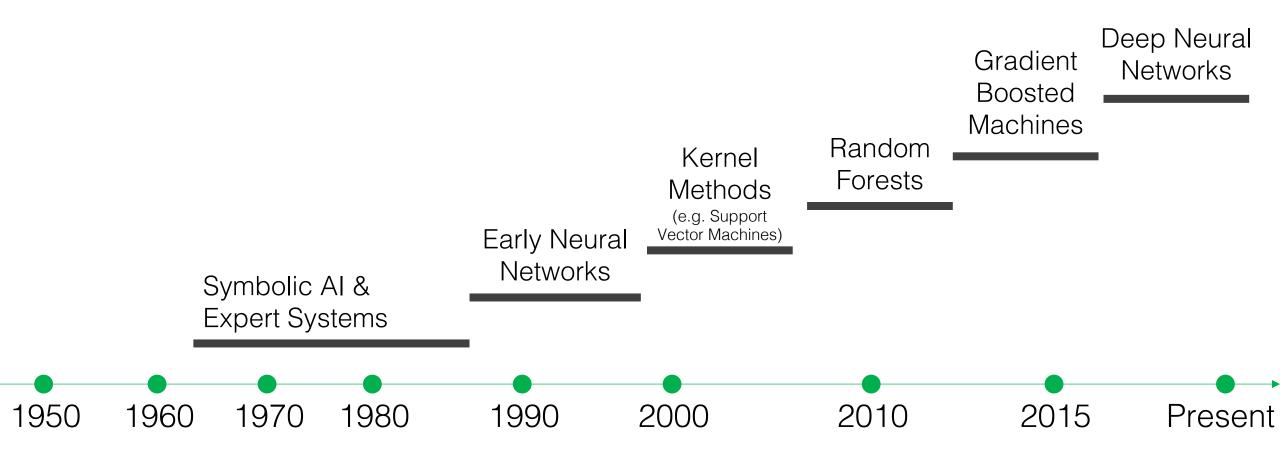

Infinitely many

Which set contains the better hypothesis? Which set has more options to consider? What is our learning algorithm?

Next time

Model flexibility and the bias variance tradeoff

Historic Progression of Algorithms
